NUCLEAR MATERIALS

Materials and Chemistry for Molten Salt Systems

The use of molten salts as a coolant in molten salt reactors (MSR) and concentrating solar power (CSP) systems offers many advantages including low operating pressures, high temperatures, and favorable heat transfer. Molten salts are also widely used in the metal processing and nuclear fuels reprocessing industries. Despite the advantages, the highly aggressive molten salts present a challenging environment for salt-facing materials.

This symposium covers all aspects of materials science, chemistry, and electrochemistry in molten salt systems for diverse purposes such as energy transfer, energy storage, metallurgical processing, and actinide recovery. Abstracts are solicited in, but not limited to, the following topics:

- Corrosion of salt-facing materials
- Salt effects in graphite and moderator materials
- Fission product embrittlement
- Alloy selection and design for molten salt applications
- Interaction of fission products with materials
- Mechanical and creep properties
- Electrochemistry for metal processing and actinide recovery
- Salt chemistry effects on materials including radiolysis
- Heat exchanger design
- Welding and cladding issues
- Waste handling and actinide recovery
- Electrochemistry for salt property evaluation

ORGANIZERS
Stephen Raiman, Texas A&M University
Raluca Scarlat, University of California, Berkeley
Jinsuo Zhang, Virginia Polytechnic Institute and State University
Michael Short, Massachusetts Institute of Technology
Kumar Sridharan, University of Wisconsin-Madison

SYMPOSIUM SPONSORS
TMS Structural Materials Division
TMS Corrosion and Environmental Effects Committee
TMS Nuclear Materials Committee
