ADVANCED MATERIALS

Bulk Metallic Glasses XVI

The goal of this symposium is to provide fundamental understanding and theoretical modeling of processing and mechanical behavior of bulk metallic glasses (BMGs).

In the last decade, new approaches to fabricating metallic glasses [i.e., by utilizing unique combinations of elements to form metallic-glass alloys] have resulted in the required cooling rate dropping from 10⁵ C/s to as low as 1 C/s, and the specimen size increasing from 0.05 mm to as large as 80 mm. Because of the large sizes possible with this exciting technology, the metallic glasses are called BMGs.

Mechanical behavior of BMGs is among the new, exciting fields of research that are fully illustrating their advantages over crystalline alloys. Generally, BMGs have higher fracture strengths, fracture toughnesses, and elasticities than their crystalline counterparts. There is great interest in BMGs for use in biomedical, structural, and mechanical applications.

Some of the areas to be explored include:

- Material fabrication and processing
- Nanocrystalline materials and composites
- Mechanical behavior
- Shear band formation, fatigue, deformation, and fracture mechanisms
- Corrosion, physical, magnetic, electric, thermal, and biomedical behavior
- Theoretical modeling and simulation
- Industrial applications

ORGANIZERS

Xie Xie, FCA US LLC, USA

Peter K. Liaw, University of Tennessee, USA

Yanfei Gao, University of Tennessee, USA

Hahn Choo, University of Tennessee, USA

Yunfeng Shi, Rensselaer Polytechnic Institute, USA

Gongyao Wang, Alcoa, USA

Robert Maass, University of Illinois at Urbana-Champaign, USA

Muhammad Musaddique Ali Rafique, Royal Melbourne Institute of Technology, Australia

Nearly 4,000 presentations are planned
 at more than 80 symposia at TMS2019.
