MECHANICS OF MATERIALS

Dynamic Behavior of Materials X

The dynamic behavior of materials encompasses a broad range of phenomena with technological applications in both the military and civilian sectors. Examples of such phenomena include deformation, fracture, fragmentation, shear localization, chemical reactions under extreme conditions, and processing (combustion synthesis; shock compaction; explosive welding and fabrication; shock and shear synthesis of novel materials).

It is recognized today that materials aspects are of utmost importance in dynamic events. The macromechanical and physical processes that govern the phenomena manifest themselves, at the microstructural level, by a dazzling complexity of defect configurations and effects. Nevertheless, these processes/mechanisms can be quantitatively treated on the basis of accumulated knowledge.

The advent of in-situ techniques available at facilities like APS-DCS, LCLS, NIF, Omega, Diamond Light Source, European XFEL, pRad, and DMMSC have enabled researchers to make significant strides towards gaining more insights into the basic mechanisms that drive materials response under dynamic loading. These, coupled with modeling tools from continuum to ab-initio computations, enable realistic predictions of material performances and are starting to guide not only the design process but also our further micromechanical understanding of deformation processes at every level, including the basic dislocation mechanisms.

In addition to traditional materials, we have also made progress in understanding the extreme response of emerging materials, such as nano-crystalline, bulk metallic glasses, and high entropy alloys.

ORGANIZERS
Eric Brown, Los Alamos National Laboratory, USA
Saryu Fensin, Los Alamos National Laboratory, USA
George Gray, Los Alamos National Laboratory, USA
Marc Meyers, University of California-San Diego, USA
Neil Bourne, University of Manchester, United Kingdom
Cyril Williams, US Army Research Laboratory, USA
Mukul Kumar, Lawrence Livermore National Laboratory, USA
Nicola Bonora, University of Cassino, Italy

SYMPOSIUM SPONSORS
TMS Structural Materials Division
TMS Mechanical Behavior of Materials Committee
